

NEW INK SUPPLY FOR OFFSET UV INK

After careful research of materials and new technologies, we have developed a pumping system for UV inks. Entirely designed and manufactured at our facility, meet all the demands and attention that the particular ink requires. The selection of components and their construction guarantee an optimal operation combined with a simplicity of use.

The system can be supplied in various versions:

- Single with dispensing: a pneumatic pump to delivery ink into cans up to 5 Kg.
- Modular with dispensing: a single structure that includes four or more pumps and a practical table for dispensing ink from drums of 200 Kg into cans.
- Automatic: designed to supply directly the machines by applying the know-how of UV pumps to the established technology of our low pression "ELCOLORA" ink supply system.

Currently the range includes two ink pump sizes for 200 Kg barrels, able to cover the supply required from printing machines or ink manufacturers.
